

A man with dark, wavy hair and a light beard is shown in profile, looking down at a smartphone he is holding in his right hand. He is wearing a dark, vertically striped shirt. The background is a solid, light blue-grey color.

WebM8s

Mobile application to
find people you need

App Vision

Our vision for WebM8s is to create an app designed to help people find groups of friends.

Our target audience includes individuals of all genders and age groups, though we expect that most of our users will be between the ages of 14 and 24.

According to the [AACAP data](#) teens spend up to 9 hours of free time looking at screens, and everyone needs someone to share that time with. Unfortunately, for many reasons, a lot of people lack online friends, and this is where our app comes in to help.

We want every user of our app to feel comfortable and find people who match their personality.

Scope

Thanks to our personality tests and character assessments, users will be able to create detailed profiles and use them to search for new groups of friends. These groups will be suggested based on their interests, preferences and needs.

Our app will not include matchmaking or pairing features, nor will be a platform for sharing photos, whether in profiles or conversations. We are focusing primarily on fostering virtual connections and will limit the facilitation of in-person meetings, mainly for safety reasons.

Choose the best community

Have fun with new friends!

Why WebM8s?

Our application addresses three key user needs:

- **Meeting New People:** The app facilitates meeting new groups of people based on user data.
- **Groups and Subcultures:** Users can join interest-based groups or subcultures and participate virtually, creating a sense of belonging in aligned with their passions.
- **Online Entertainment:** The app provides spaces where users can engage in gaming, quizzes, and digital entertainment together, integrating tools for online social activities.

User Personas

Michael

Michael is 16 years old, lives in London, and is a high school student. Although he's an introvert, he has a few close friends; however, they don't enjoy playing the same game as he does—League of Legends. While he's not looking for new friends to meet up with in person, he is interested in finding people to form a team with for online gameplay. While searching for an app to find gaming buddies, Michael comes across Web8s.

Andrzej

Andrzej is a 42-year-old from Poland who has recently begins treatment for his alcoholism. His doctor recommended that he find a sobriety support group, but there's nothing like that in the area near his small village. A few weeks ago, however, Andrzej's cousin, Mariusz, told him about an app where he could connect with people from around the world. Andrzej decides to give it a try.

Anastazia

Anastasia, a 26-year-old woman, recently decided she wants to develop a deeper interest in cinema. She would like to learn how to analyze films in a more meaningful way, but she doesn't know where to start—she struggles to apply what she's read online in practice. Anastasia would love to discuss films with people who are knowledgeable and learn what to pay attention to while watching movies through real examples. She decides to try the app after seeing an advertisement.

Use Cases

Michael

Michael decides to give WebM8s a try, generates his profile, and starts searching for his new team. After just a few minutes of browsing, he forms a new group by pairing up with one person, and within an hour, their group grows to four people who not only fit perfectly into the needed roles for the game but are also incredibly fun to chat with. After a few hours of messaging with his new friends, Michael decides to add them in-game, where they continue their conversations over voice chat.

Andrzej

After installing the app, Andrzej quickly sets up his profile thanks to the simple interface. Within five minutes of searching, he finds a small group of eight people.

Everyone in the group is very friendly, sharing daily updates about their day, how they're feeling, and what helps them in their recovery journey. This shared support makes it easier for everyone in the group, including Andrzej, to navigate their treatment. Andrzej decides to tell his cousin on the other side of the family about the app.

Anastazia

Anastazia was initially skeptical, but after creating her profile and finding one of the groups, her attitude shifted instantly. She enjoyed the app so much that she decided to join several more groups. Now, she engages daily in conversations with other group members and has noticed that she increasingly understands the deeper insights of directors and screenwriters.

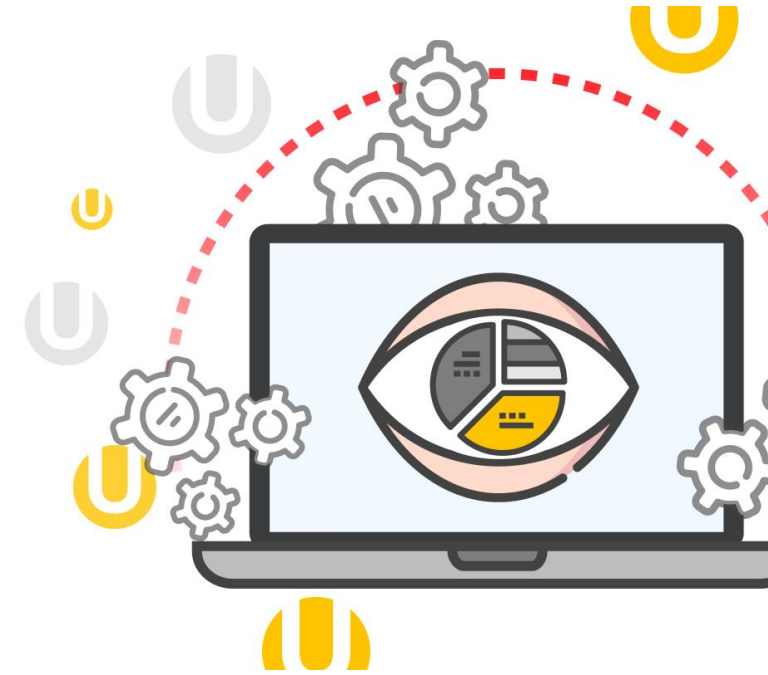

Functional and Non-Functional Requirements

Functional:

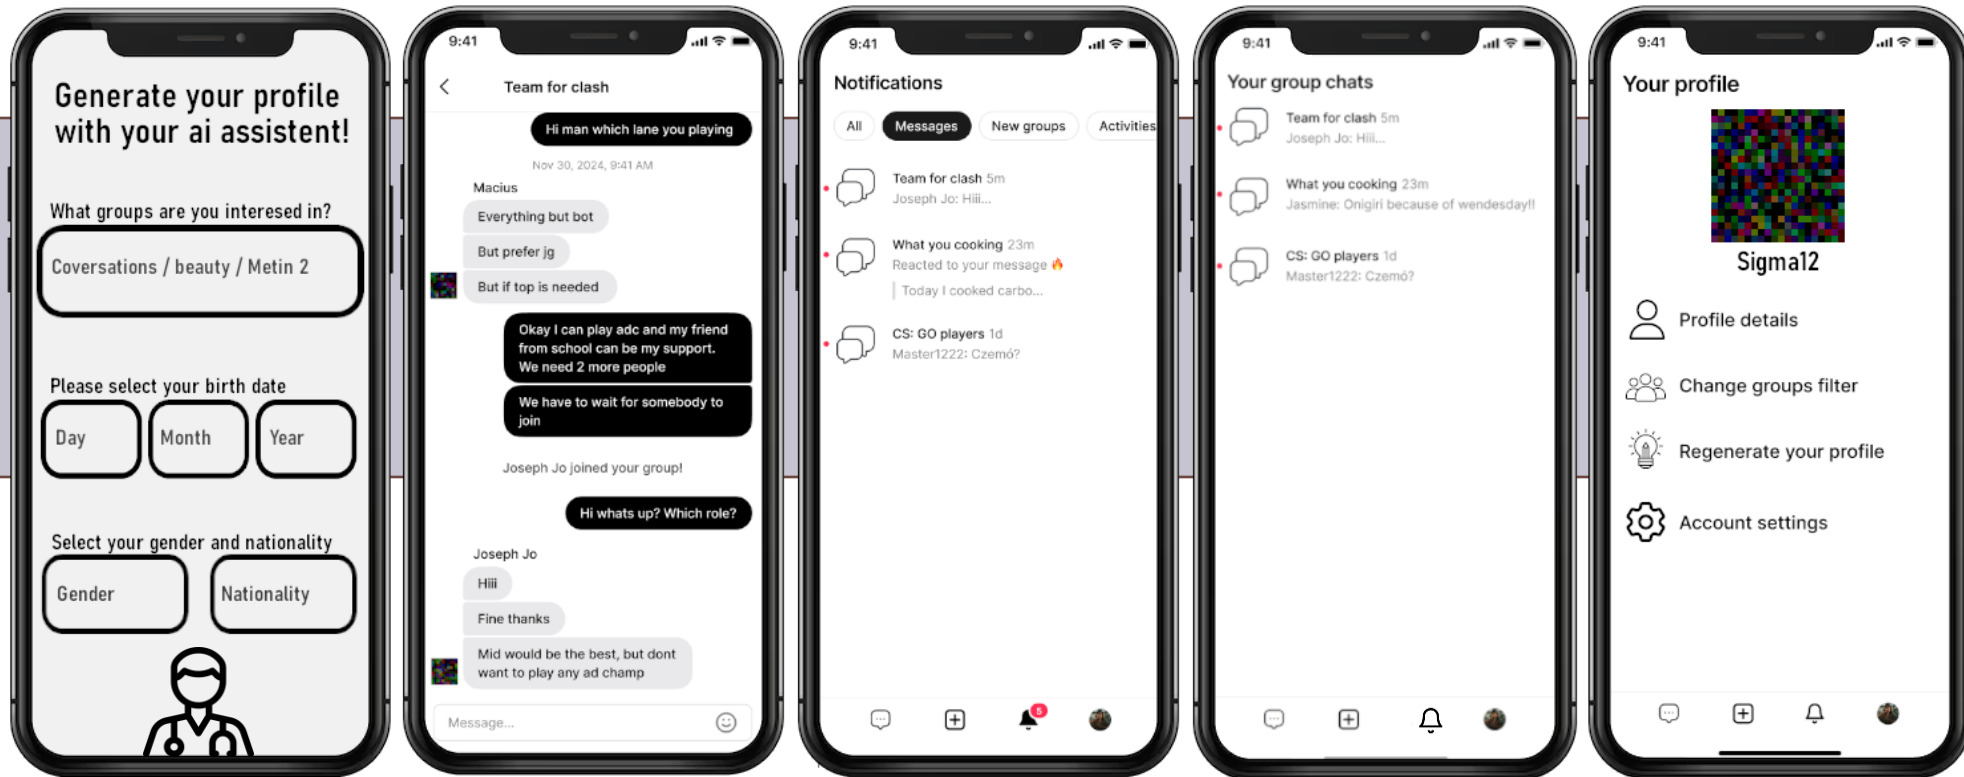

- **User Registration & Authentication:** Users can create accounts and log in securely.
- **Interest-Based Filtering:** Customizable profiles to match users with groups of similar interests.
- **Group Creation & Management:** Users can create new groups, invite others, and manage them.
- **Chat & Communication Tools:** Real-time messaging to facilitate communication within groups.
- **Content Sharing:** Allows users to share files, images, and links within group discussions.
- **Notification System:** For group activity, messages, and upcoming events.

Non-Functional:

- **Scalability:** The app must support thousands of concurrent users as the platform grows.
- **Performance:** Pages and features should load within 2 seconds for a seamless user experience.
- **Platform Compatibility:** The app must run on Android, iOS, and modern web browsers.
- **Usability:** A clean, intuitive interface with easy navigation for all user types.

Risk Assessment and Mitigation Plan

Data Privacy and Security Concerns

We need to ensure GDPR, implement end-to-end encryption, multi-factor authentication (MFA) and conduct regular security audits.

Platform Downtime and Scalability Challenges

We will employ cloud-based infrastructure with redundancy, real-time monitoring, and scalable solutions to ensure platform reliability.

Budget Constraints

We will monitor expenses and establish strict budget controls.

Mismatch in Group Recommendations

In WebM8s we use AI-based matching systems, refine algorithms continuously using user feedback, and provide manual customization options for better match.

Slow User Adoption and Engagement

To encourage usage we want to launch targeted marketing campaigns, incentivize referrals, and focus on intuitive and simple design.

**Data Privacy
and Security Concerns**

**Mismatch in Group
Recommendations**

		Potential Severity Rating			
		Minor	Moderate	Significant	Catastrophic
Likelihood severity occurs	Very Likely	Moderate	High	Extreme	Extreme
	Likely	Low	Moderate	High	Extreme
	Unlikely	Very Low	Low	Moderate	High
	Rare	Very Low	Very Low	Low	Moderate

**Platform Downtime and
Scalability Challenges**

Budget Constraints

**Slow User Adoption
and Engagement**

Testing Plan

The WebM8s testing plan will follow a clear strategy to make sure the app's main features work well, are reliable, and easy to use. This plan will include test cases for key features like finding groups, chatting with others, and managing accounts. We'll describe the different types of tests needed, the tools we'll use, and a schedule that explains when each test will happen, how long each test will take, and who will be responsible for it.

Test Types

Unit Testing

Purpose: We ensure that each small part of the app works correctly on its own.

Scope: Testing small functions like creating a user profile, filtering age, games and selected topic.

System Testing

Purpose: Ensure WebM8s functions as a complete, integrated system, verifying performance, security, and reliability.

Scope: Test the full application for defects, end-to-end workflows, and requirement compliance to prepare for User Acceptance Testing.

UNIT TESTING

Test Individual Component

INTEGRATION TESTING

Test Integrated Component

SYSTEM TESTING

+ ✨ Test the entire System

ACCEPTANCE TESTING

Test the final System

Integration Testing

Purpose: We confirm that all parts of the app work well together.

Scope: For example, we test how features like user registration and saving data connect seamlessly.

User Acceptance Testing (UAT)

Purpose: Validate that WebM8s meets user needs by testing usability, functionality, and real-life performance.

Scope: Launch the beta version to prove customer requirements are met. UAT lasts two months or until 20,000 users register.

How will user acceptance tests work in WebM8s?

Selecting real users

We'll encourage with advertisements people of our target audience – gamers, community seekers, chat enthusiasts. We want to acquire 10,000 test users.

Testing real-life scenarios

Users will go through typical workflows, such as:
Logging in and generating profiles.
Searching for groups that match their interests and joining them.
Participating in chat conversations and utilize the app's features..

Gathering feedback

Testers will share their experiences on app store reviews and social media: What they loved, what was a cumber or felt confusing, and what needs to be improved. Their insights will help us adjust the app to better meet user expectations.

Focus areas

Ease of use: Is the app simple, intuitive and safe for users?
Performance: Does it work fast, reliably and as intended?
Engagement: Does the app create fun and welcoming experience?

Delivery Process and Organization

Our project will use the Kanban methodology, focusing on visualizing work, limiting tasks in progress (WIP), and continuously improving processes. This approach allows the team to adapt quickly to changes and efficiently manage tasks. Kanban provides the flexibility our small team needs, supporting smooth collaboration and effective project goal alignment. We have planned weekly meetings to review progress and make necessary adjustments. Tasks will be handled individually, following WIP limits.

Organization tools

Canva Board

We are going to use the canva board to spread task and visualise our work

Discord

Discord shall be the main service we will use for communication

Github Repository

We will use the Github repository to keep our project code

Data Privacy and Security Plan

At **WebM8s**, we will protect user data with strong security tools such as **AES-256** encryption.

In the future, we will also conduct regular security tests, such as **penetration testing**, to find and fix vulnerabilities.

We will also implement two-factor authentication (**2FA**) to add an extra layer of protection to user accounts.

We plan to use intrusion detection systems (**IDS**) to monitor for suspicious activity and prevent attacks.

Data sent between users and our servers will be secured with **SSL/TLS** protocols, preventing it from being stolen.

That will help us create a secure and trustworthy environment for everyone.

Potential Security Risks and Mitigation

Data Breach

Issue: Unauthorized access to user data (e.g., email, usernames).

Mitigation: Encrypt sensitive data (AES-256), secure servers, and monitor for suspicious activity.

Account Hacking

Issue: Weak passwords or stolen credentials may allow unauthorized access.

Mitigation: Require strong passwords, implement two-factor authentication (2FA), and lock accounts after multiple failed login attempts.

Phishing or Fake Accounts

Issue: Malicious users might impersonate others to steal information.

Mitigation: Enable user reporting features, verify accounts, and educate users about online safety.
